

Attended meeting: Javier Ramirez
Tai Pham

Discussion:

We discussed the critical areas from part 3 project report. What would be the most important part we have to implement in our paper prototype.

Below are what we discussed to be our critical areas of the iphone interface:

1. The first critical area we will be exploring for this part is health features screen which include beats per minute, blood pressure. The second critical area is the fitness tracker which tells you how active you've been in the day and if you need to be more active or not. The third critical area is when the user enter personal information into the watch.
2. Example tasks:
 - User will be able to put in their information.
 - User will be asked to check their fitness by having a fitness tracker.
 - User will be asked to check up on their distance traveled.
 - User will be ask to check their bpm
 - User will be ask to check their blood pressure

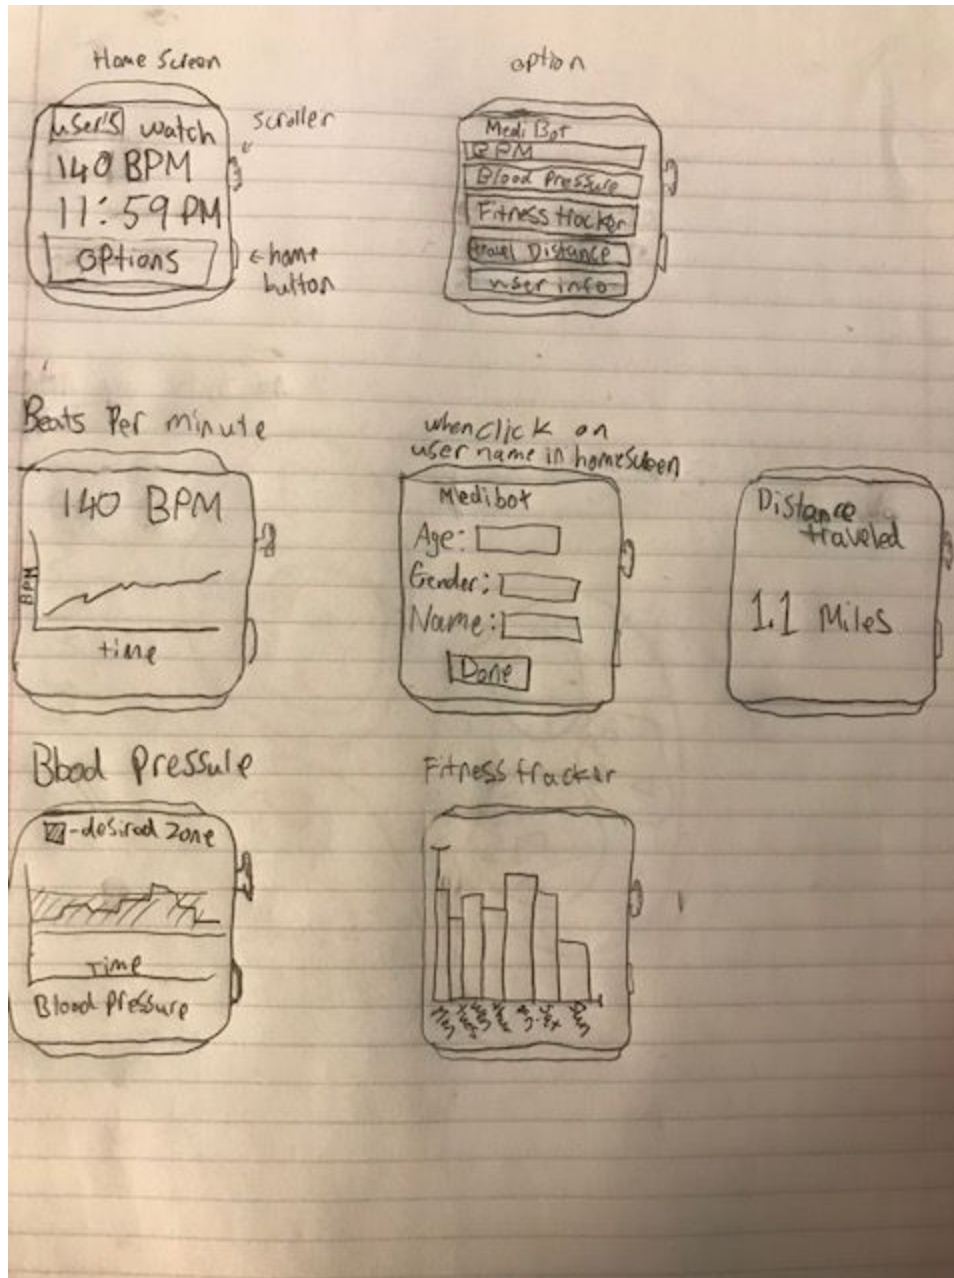

Study Task-

- You just bought the new watch, set up the watch.
- You have been feeling tired recently you want to find some way to correlate this with how much active you've been, check on your fitness this week.
- after a long and tiring day, you want to know how much you have moved around, check to see how many miles you've walked or run.
- after eating so much mcdonalds, you feel funny so lets check on your pulse.
- you just stood up too quick and feel a head rush, lets check up on your blood pressure.

Notes:

We should have limited features displayed, because a watch user interface would not have much room for many features to be displayed all at once. Have a scroll ability and design it in a way that tell the user what tab they are choosing such as check beats per minute in bold and in a visible box to help show that it is clickable and have the most popular features displayed at the top when they open the app.

Step 2:

Step 3:

<https://www.figma.com/file/S3EdgYdQTW4mPXoLj6YVxcik/Untitled?node-id=0%3A1>

note : the ability to enter your name and some personal info should be done by clicking on the user info and changing it
